

Care instructions for aerators

Cleaning

The aerator will remain in good function if the strainer is carefully brushed every now and then. Use a soft brush while letting the water flow.

In areas with much lime, the aerator can be soaked in vinegar for a couple of minutes up to an hour. After reassembling the aerator, carefully brush its strainer with a soft brush while letting the water flow.

Another way is to fill a spray bottle with vinegar and spray the outside of the strainer every now and then. Brush with a soft brush after a couple of minutes. Easy and environment-friendly!
